

**FAQ Generator 2.5**  
Install Guide

It should not take more then a few minutes to install this application, all you have to do is create a database connection and then just add a few frequently asked questions to the system. You also need to create (change) the default username and password.

### 1. Create Database Connection

Open file settings.asp and scroll down to line 21 where it says SUB OPEN\_DB()  
There you need to create your database connection. There are 4 samples presented so you only need to modify it and enable one of those connections. To enable the connection simply remove the ' character in front of it. Here is an example of DSN connection:

```
Set MyConn = Server.CreateObject("ADODB.Connection")  
MyConn.open = "DSN=dsn_name"
```

### 2. Change your username & password

Open file settings.asp and change the value 'admin' in USERNAME and PASSWORD variable. You can change it to whatever you want, but make sure it's something not common and longer than 5 characters.

### 3. Add New FAQ

You need to go to the administration and add at least one FAQ, so the system has something to work with. Go to: <http://www.YourHost.com/FAQ/Admin/>  
And enter your username and password, then simply add your FAQs.

### 4. Customizing The Public Side

To add your website layout to the FAQ Generator simply open the index.asp file and add your site layout between the designated lines.
